Where the sandbox start goes

Same thousand sandboxes, same image, same 16 MiB disk. Three runs on each chip. All 1000 came up, from the snapshot.

Vera is green. The 9575F is grey. A darker bar is the control plane accepting the request. A lighter bar is the wait for a runner.

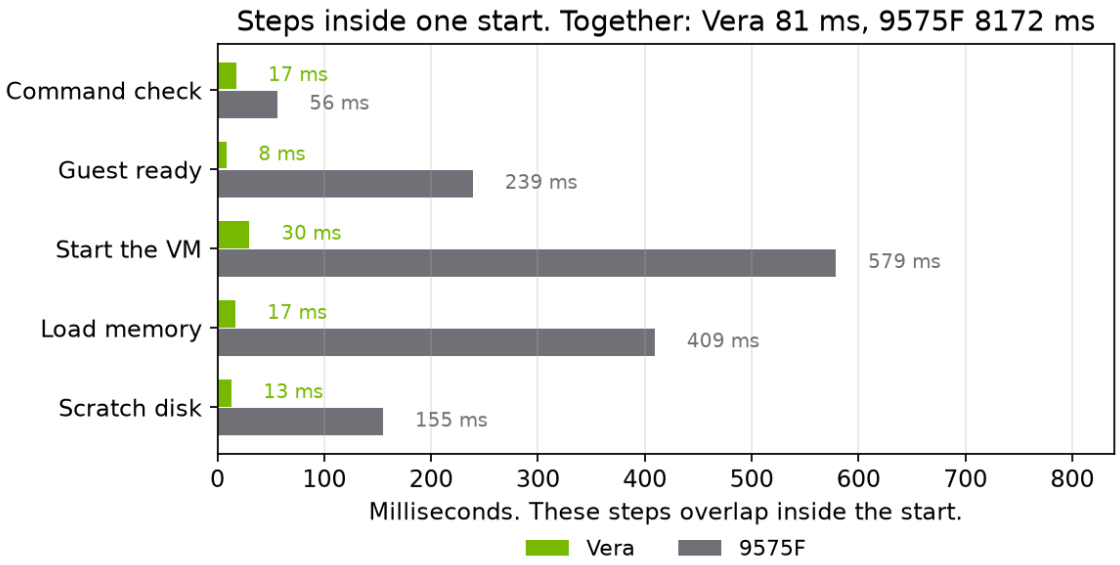

Vera's start is about 80 milliseconds. On the 9575F the same start is 7.2, 8.9, and 8.5 seconds. The batch is 18.7, 18.9, and 19.1 seconds on Vera. On the 9575F it is 35.0, 30.6, and 33.4 seconds.

The 9575F is one 64-core socket. The Vera numbers are the OCI box, both sockets.

	Vera 1	Vera 2	Vera 3	9575F 1	9575F 2	9575F 3
First, ready	0.3 s	0.3 s	0.3 s	0.2 s	0.2 s	0.1 s
Typical, control plane	5.2 s	5.4 s	5.9 s	7.8 s	7.1 s	7.8 s
Typical, waiting for a runner	3.9 s	3.8 s	3.5 s	9.2 s	8.7 s	8.9 s
Typical, ready	9.2 s	9.2 s	9.6 s	17.8 s	16.2 s	16.6 s
Last, control plane	11.3 s	9.0 s	12.5 s	4.0 s	17.8 s	9.5 s
Batch	18.7 s	18.9 s	19.1 s	35.0 s	30.6 s	33.4 s

A typical sandbox is ready in about 9 seconds on Vera and about 16 to 18 seconds on the 9575F. The last request's accept overlaps. It is 11.3, 9.0, and 12.5 seconds on Vera, and 4.0, 17.8, and 9.5 seconds on the 9575F.

Step	Vera 1	Vera 2	Vera 3	9575F 1	9575F 2	9575F 3
Scratch disk	13 ms	13 ms	13 ms	156 ms	166 ms	143 ms
Load memory	17 ms	17 ms	16 ms	425 ms	426 ms	377 ms
Start the VM	29 ms	31 ms	30 ms	450 ms	752 ms	535 ms
Guest ready	8 ms	9 ms	8 ms	226 ms	247 ms	244 ms
Together	79 ms	83 ms	81 ms	7155 ms	8906 ms	8456 ms
Command check	17 ms	18 ms	17 ms	55 ms	56 ms	58 ms

Scratch, memory, the VM, and guest ready run at the same time. Together they are the start. Vera is faster on every one of those steps. The command check is a few tens of milliseconds on both.

Onsite Vera finishes the same thousand in about 11 seconds. This OCI box is slower because the host memory is different.
